Card Payments for SAP

HighRadius Payments for SAP is a PCI-DSS Compliant robust electronic payments solution for SAP applications that enables merchants to accept credit card and other payment types electronically with full integration into their SAP system. A cloud-based solution available as Software-as-a-Service, Card Payments for SAP leverages modern technologies and processor tokenization services maximizing credit card security.
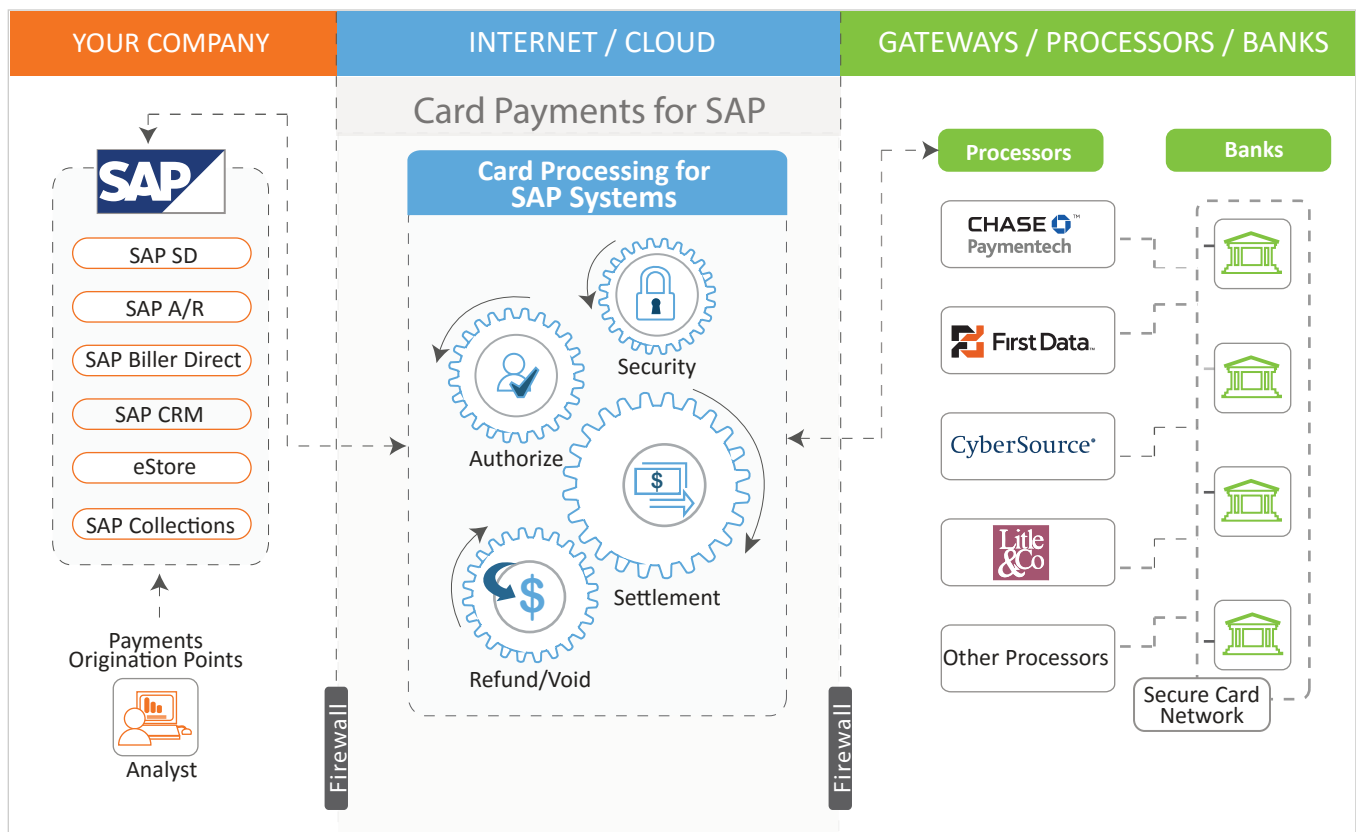

Challenge

The inability to provide multiple payment methods reduces a company's ability to grow revenue. Furthermore, limiting customer payment options to traditional paper checks and cash increases Days Sales Outstanding (DSO) and collection risk. While SAP provides standard means to enter payment information, the native SAP functionality does not provide the integration needed with the payments industry to complete such transactions. Additionally, credit card security is a top priority for merchants as compliance with PCI-DSS is mandatory to avoid any fines from credit card companies.

Solution

Payments for SAP enables companies to accept credit card and debit card payments across SAP solutions, such as order management, accounts receivable, collections, disputes, Biller Direct, and e-commerce. The PCI-DSS compliant solution uses cloud technology to leverage processors' tokenization services which eliminates the need for the merchant or HighRadius to store credit card information. This minimizes risk and the effort and cost of achieving PCI-DSS compliance for the merchant. A low footprint, native SAP component speeds up deployment while eliminating the need for additional hardware.

Revenue is paramount to any business. Unlock your companies true potential by enabling your customers to pay the way they want at the time they want. great start to an efficiency initiative!
